

How SkorX points and rankings work

A plain-language guide to what every match does to your SkorX numbers, with real worked examples.

Every player has three numbers

SkorX gives you three numbers because they answer three different questions: how much you've achieved, how good you are right now, and how you've been playing lately.

SkorX Points

SXP

Your career total. Every counted match adds points. SXP **never goes down**, even when you lose.

Decides your **level** (First Serve → SkorX Legend).

Power Index

SPI

Your skill right now, on a 0–100 scale. It goes **up and down** depending on how you play against the people you face.

Decides your **rank**, and how strong you count as when others play you.

Form

Heat

Your recent form: how much better or worse than expected you've played over your last 10 rated matches, as a %.

Shown as a label, from **On Fire** to **Ice**.

The one idea behind everything: before every match, SkorX works out what share of the points each side *should* win, based on everyone's Power Index. Afterwards it compares that with the share you *actually* won. Beating that expectation is what raises your SPI and your Heat, and it earns bonus SXP. You don't have to win to do well: losing 9–11 to a much stronger player *raises* your SPI.

Why points, not just wins?

SkorX looks at the **points** you won across all games, not just who won the match. Winning 11–2 and winning 11–9 are very different performances, and SkorX treats them differently. This makes ratings fairer and faster to settle, because every rally counts as evidence.

Everyone's SPI
before the match

Expected share
of points for each side

Actual share
of points you won

SXP gained
+ SPI up or down

1 The expected share of points

When two players (or teams) with equal Power Index meet, SkorX expects each to win **50%** of the points. The bigger the gap in SPI, the bigger the share it expects the stronger side to take.

You (SPI)	Opponent (SPI)	SkorX expects you to win
50	50	50% of points
60	50	about 55%
72	32	70%
32	72	30%

Doubles: the weaker partner counts a little more

A team's strength is a blend of both partners, weighted **55% to the weaker player and 45% to the stronger**, because opponents tend to aim at the weaker player. For example, partners at 72 and 32 play like a team of about **50**, and partners at 60 and 52 play like a team of about **55.6**.

2 How your Power Index (SPI) moves

After the match, SkorX compares the share of points you won with the share it expected:

- **Won more than expected:** your SPI goes **up**.
- **Won less than expected:** your SPI goes **down**.
- **Won about what was expected:** your SPI barely moves, even if you won the match.

How big the move is

What affects the size	How
How far you beat or missed the expectation	The bigger the gap, the bigger the move.
How new you are	New players' SPI moves fast so it finds the right level quickly. It settles down as you play more (it learns about 5× faster at 0 matches than after 40 or more).
How trustworthy the score is	Tournament-verified scores count in full. Self-reported scores never move SPI. (See the trust levels in section 3.)
Casual match	Counts 70% as much for SPI.
Match ended in a retirement	Counts 50% for SPI.
How well SkorX knows the other players	If your opponents or partner are brand-new and their SPI isn't settled yet, the result counts a little less.
Safety limit	One match can only move your SPI so far: a bigger limit for your first 10 rated matches (<i>provisional</i>), a smaller one after that (<i>confirmed</i>). At SPI 50 that's roughly ±5 points once confirmed.

Everyone starts at SPI 35. Your SPI is kept **separately for each format** (e.g. singles and doubles), because you can be much stronger in one than the other. Your overall SPI is the average of your formats, weighted by how many matches you've played in each.

3 How SkorX Points (SXP) are earned

Every counted match earns SXP in two steps: **four credits** add up to a base score, then **multipliers** adjust it for who you played, what kind of match it was, and how trustworthy the score is.

Step 1 · The four credits

Credit	What you get	Range
Played	For turning up and finishing the match.	2
Point performance	10 × the share of points you won. Win 60% of the points → 6.	0 – 10
Win bonus	Only if you win: 4, plus up to 4 more the more dominant the win. 11–9 → 4.4, 11–2 → 6.8.	0 – 8
Beat expectation	25 × how far your point share beat the expected share. Never negative.	0 +

Step 2 · The multipliers

Multiplier	What it does	Values
Opponent strength	Stronger opponents are worth more.	0.4 vs SPI 0 → 1.0 vs SPI 50 → 1.6 vs SPI 100
Match type	How important the match is.	Casual 0.6 · Club 0.8 · League 1.0 · Tournament 1.2 · Championship 1.4
Stage	Later rounds count a little more.	Pool 1.0 · Quarter-final 1.05 · Semi-final 1.10 · Final 1.15 Type × stage is capped at 1.6.
Trust	How sure SkorX is that the score is real.	See table below.
Repeat opponent	Playing the same line-up again and again within 30 days earns less each time.	100% → 70% → 49% → 34% ... never below 15%
Busy day	From your 7th match of the day, matches earn half.	1.0, or 0.5
Gravity	If your SXP is far above what your skill supports, gains slow down (see section 8).	1.0 normally

Match cap: one match can earn at most **60 SXP**. SXP gained is never negative, so **you never lose SXP by playing**.

Trust levels

Level	Who confirmed the score	SXP counted	SPI counted
T1	Tournament verified (scored live by the event's scorer)	100%	100%
T2	Organiser verified (e.g. league results)	95%	95%
T3	Player verified (live-scored in the app by a player)	80%	80%
T4	Self-reported	60%	0%
T5	Unverified	0%	0%

Only T1–T3 matches count towards SPI, Heat and rank. In the current app, trust is set by match kind: tournaments T1, leagues T2, friendlies T3.

4 A worked example, step by step

Arjun (SPI 72, 60 matches played) beats **Bhavin** (SPI 32, 25 matches played) **11–2** in an organiser-verified league match.

Arjun (the favourite, wins 11–2)

Step	Value
Expected share of points	70%
Actual share (11 of 13)	84.6%
Played	2.00
Point performance (10×0.846)	8.46
Win bonus (dominant win)	6.77
Beat expectation (25×0.146)	3.64
Base	20.88
× Opponent strength (Bhavin 32)	× 0.784
× League	× 1.0
× Trust T2	× 0.95
SXP earned	+15.5
SPI	72 → 73.6

Bhavin (the underdog, loses 2–11)

Step	Value
Expected share of points	30%
Actual share (2 of 13)	15.4%
Played	2.00
Point performance (10×0.154)	1.54
Win bonus	0
Beat expectation	0
Base	3.54
× Opponent strength (Arjun 72)	× 1.264
× League	× 1.0
× Trust T2	× 0.95
SXP earned	+4.2
SPI	32 → 29.7

Same players, closer scores

Result	Arjun SXP	Arjun SPI	Bhavin SXP	Bhavin SPI
Arjun wins 11–2 (dominant, as expected or better)	+15.5	72 → 73.6	+4.2	32 → 29.7
Arjun wins 11–9 (scrappy win)	+8.9	72 → 70.3	+12.3	32 → 34.5
Bhavin wins 11–9 (upset!)	—	—	+21.8	32 → 36.3

Notice: when Arjun only scrapes an 11–9 win, **his SPI goes down** and Bhavin's goes **up**, because Bhavin took 45% of the points when SkorX expected only 30%. Bhavin also earns **more SXP** for that loss (12.3) than Arjun does for the win (8.9). An upset earns the most of all.

5 Rankings

- **Rank is decided by Power Index (SPI), not by SXP.** SXP rewards how much you've played and achieved; SPI measures how good you are now. Someone who plays a lot but isn't beating expectations will climb levels but not rankings.

- Rankings are **per format**, because each format has its own SPI.
- Only **trusted matches (T1–T3)** can move SPI, so self-reported results can't be used to climb the rankings.
- Your first **10 rated matches** in a format are **provisional**: your SPI moves faster while SkorX finds your level. After that your SPI is **confirmed**.

Status: the engine calculates SPI today. Public leaderboards ranked by SPI are still to be built; the sample leaderboards in the app currently show sample values.

6 Levels

Your SXP decides your level. From level 3 up, a level also needs enough **verified matches** (T1–T3) and, from level 7, **tournament matches**. If your SXP is high enough but a requirement is missing, the level shows as *locked* until you meet it.

#	Level	SXP	Also needs
1	First Serve	0	—
2	Return Ready	100	—
3	Dink Crafter	200	10 verified matches
4	Kitchen Regular	300	Confirmed rating (10 verified matches)
5	Third-Shot Artist	400	20 verified
6	Transition Hunter	500	25 verified
7	Net Commander	600	30 verified · 3 tournament
8	Firefight Specialist	700	40 verified · 6 tournament
9	Erne Striker	800	50 verified · 10 tournament
10	ATP Maestro	900	60 verified · 15 tournament
11	Kitchen Sovereign	1000	80 verified · 20 tournament
12	SkorX Legend	1200	100 verified · 30 tournament

Example: 684 SXP with 30 verified matches but only 2 tournament matches → **Transition Hunter** (level 6), with Net Commander locked until a 3rd tournament match.

7 Heat (recent form)

Heat compares the share of points you won with the share SkorX expected, over your **last 10 trusted matches**. Recent matches count more than older ones, and bigger matches count slightly more. It appears after your **3rd** trusted match.

Heat	Label
above +20%	🔥 On Fire
+12% to +20%	Hot
+5% to +12%	Warm
−5% to +5%	Steady
−15% to −5%	Cool
below −15%	Ice

8 Keeping it fair

Rule	Stops	Example
Repeat opponent fade	Farming points off the same easy opponent	Arjun beats Bhavin 11–4 in five club matches in a month: +8.0, +5.6, +3.9, +2.8, +1.9 SXP
Busy-day half rate	Grinding dozens of matches in a day	A 9th casual match of the day earns 3.5 instead of 7
Gravity	SXP drifting far above real skill	Your "comfortable" SXP is $200 + 10 \times \text{SPI}$. At SPI 32 that's 520. Every 100 SXP above it halves your gains: a player at SPI 32 with 700 SXP earns only 29% (4.8 instead of about 17)
Trust levels	Made-up scores	A self-reported casual win earns 6.2 SXP and leaves SPI exactly where it was
SPI step limit	One freak result swinging a rating	Two equal players at SPI 50; one wins 11–1. The winner's SPI only goes to 55.0
60 SXP match cap	One match earning a huge amount	—

9 More examples

Situation	SXP	SPI
Chirag (SPI 50) beats Farhan (SPI 66) 11–7 in a championship final , tournament-verified	+34.0	50 → 53.1
Neel, a new player (SPI 35, 2 matches) upsets Arjun (SPI 72) 11–9 at a tournament	+27.0	35 → 45.8
...and Arjun, for that loss	—	72 → 70.5
Doubles: Chirag (50) + partner (48) beat a 50/55 team 11–8 in a league. Both partners get the full credit	+14.5	50 → 51.4

Appendix · The exact formulas

For developers and anyone who wants to check a number. The same maths runs in the app (lib/features/rating/arc_engine.dart, engine version arc-1.0).

Expected share

```
θ          = ln( SPI / (100 - SPI) )           (SPI clamped to 1-99)
θ_team     = 0.55 · θ_weaker + 0.45 · θ_stronger (doubles)
E          = 1 / (1 + e-(0.5 · (θ_me - θ_them)))
PWR        = points won / points played        (all games summed)
```

SkorX Points

```
Raw  = 2 + 10·PWR + (won ? 4 + 4·(PF - PA)/(PF + PA) : 0) + 25·max(0, PWR - E)
ΔSXP = min(60, Raw · OD · MW · TF · RF · DF · G)

OD = 0.4 + 1.2 · SPI_opponent / 100
MW = type × stage, max 1.6
    type: casual 0.6, club 0.8, league 1.0, tournament 1.2, championship 1.4
    stage: pool 1.00, QF 1.05, SF 1.10, final 1.15
TF = T1 1.0, T2 0.95, T3 0.8, T4 0.6, T5 0
RF = max(0.15, 0.7n)      n = earlier matches vs same line-up in last 30 days
DF = 0.5 if 6+ matches already played today, else 1
G   = 1 if SXP ≤ Cap, else 0.5((SXP - Cap)/100);   Cap = 200 + 10 · overall SPI
```

Power Index

```
Δθ = clip( K · V · C · (PWR - E), ±0.45 provisional / ±0.20 confirmed )
SPI_new = 100 / (1 + e-(θ + Δθ))

K = 0.6 + 2.4 · e(-matches / 10)           (learning rate)
V = T1 1.0, T2 0.95, T3 0.8, T4/T5 0   × 0.7 if casual   × 0.5 if retired
C = average over the other players of 0.4 + 0.6 · (1 - e(-their matches / 10))
Provisional = fewer than 10 rated matches in the format.   New players start at SPI 35.
```

Heat

```
Over the last 10 matches with T1-T3 trust (newest i = 0), needs at least 3:
w_i = 0.85i · min(MW_i, 1.2)
Heat = 100 · ( Σ w_i · PWR_i / Σ w_i · E_i - 1 ) %
```
